MasterClass 12

“Gemelos digitales como herramienta para el soporte a la toma de decisiones en EDAR mediante modelado CFD e Inteligencia Artificial”

13 ABRIL

16:30 h. española

Javier Climent

CEO en HYDRENS

¿PUEDE LLEGAR A SER EL CFD UNA HERRAMIENTA DE CONTROL DE PROCESO?

GEMELO DIGITAL

V I R A L

- **Objetivo:** CFD para la operación
- **Limitación:** Coste computacional
- **Habilitador:** Artificial intelligence

IA COMO ACELERADOR DE CÁLCULO CFD

¿Qué es HYDRENS?

Consultoría medioambiental cuyo objetivo se centra en ofrecer **soluciones tecnológicas innovadoras** basadas en la mejora del **comportamiento fluidodinámico**, para incrementar el **rendimiento de los procesos**.

**Simulación computacional
de fluidos (CFD)**

**Medidas experimentales
(Instrumentación)**

**Modelización de procesos
(Simulación)**

¿Quiénes somos?

Javier Climent
– CEO –

Jose Vilarroig
– CTO –

Rosario Arnau
– Jefa de proyectos –

Pablo Carratalà
– Ingeniero CFD –

Rubén García
– Coordinador de Proyectos I+D –

Luis Caja
– Ingeniero simulación de procesos –

2023 Consolidation of HYDRENS

2019 HYDRENS Launch

2018 CFD in Drinking water and new sectors

2017 Participation in international forums (Awards)

2016 Financial projects about CFD (Open Source software development)

2015 CFD-ASM Implementación modelos bioquímicos

2014 Engineering works in WWTP and New instrumentation acquisition

2013 First CFD case validated experimentally in WWTP

2012 CFD combined with Experimental studies in WWTP

2011 CFD references in other sectors

Difusión de resultados (artículos, congresos, etc.)

“Best Paper Award” of the session of CFD Modelling in the Congress “FICWTMod2017” organized by the IWA and celebrated in Palermo, 2017.

Scientific article. “A comprehensive hydrodynamic analysis of a full-scale oxidation ditch using Population Balance Modelling in CFD simulation”. Chemical Engineering Journal. *Submitted*

Scientific article. “Retrofitting of the full scale biological reactor using CFD”. Chemical Engineering Journal, 348 (2018) 1-14.

Scientific article. “CFD biokinetics”. Chemical Engineering Journal

Conference Proceedings. “CFD simulation of a bioreactor”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Palermo, May 2017.

Conference Proceedings. “CFD simulation of clarifiers of WWTPs”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Palermo, May 2017.

Conference Proceeding. “CFD simulation of applications”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Palermo, February 2017.

Conference Proceedings. “Two-phase flow CFD simulation of hydrodynamics coupled with biological reactions in an aerated biological reactor”. Oral communication in Congress “IWA World Water Congress & Exhibition” organized by the IWA and celebrated in Brisbane, October 2016.

Conference Proceedings. “Hydrodynamics and sedimentation CFD modelling of a full-scale secondary clarifier in a transient state performance”. Poster in Congress “IWA World Water Congress & Exhibition” organized by the IWA and celebrated in Brisbane, October 2016.

Conference Proceedings. “Implementation of biochemical models ASM1 y ASM2d in a CFD model of a secondary stage of a WWTP”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Madrid, 20 and 21 June 2016.

Conference Proceedings. “CFD model of activated sludge process of WWTP”. Poster in Congress & Exhibition organized by the IWA and celebrated in Madrid, June 2016.

Conference Proceedings. “CFD simulation of a full-scale biological reactor”. Poster in Congress & Exhibition organized by the IWA and celebrated in Jerez, June 2016.

Conference Proceedings. “CFD simulation of activated sludge process”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Lisbon, September 2014.

Conference Proceedings. “Hydrodynamic efficiency of a biological reactor”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Palermo, May 2017.

Conference Proceedings. “CFD simulation of activated sludge process”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Ilmenau (Germany), July 2014.

Conference Proceedings. “Computational simulation of anaerobic digester tank”. Poster in “World Water Congress & Exhibition” organized by the IWA and celebrated in Santiago de Compostela, June 2016.

Technical review “New tools for hydrodynamic optimization of WWTP processes”. Iagua magazine, September 2014. (Spanish)

Technical review “Modeling and optimization of the sedimentation process in a secondary decanter using CFD techniques”. Water Technology Published in January 2013. Retema Magazine (Spanish)

“Implementation of biochemical models ASM1 y ASM2d in a CFD model of a secondary stage of a WWTP”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Madrid, 20 and 21 June 2016.

“CFD model of activated sludge process of WWTP”. Poster in Congress & Exhibition organized by the IWA and celebrated in Madrid, June 2016.

“CFD simulation of a full-scale biological reactor”. Poster in Congress & Exhibition organized by the IWA and celebrated in Jerez, June 2016.

“CFD simulation of activated sludge process”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Lisbon, September 2014.

“Hydrodynamic efficiency of a biological reactor”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Palermo, May 2017.

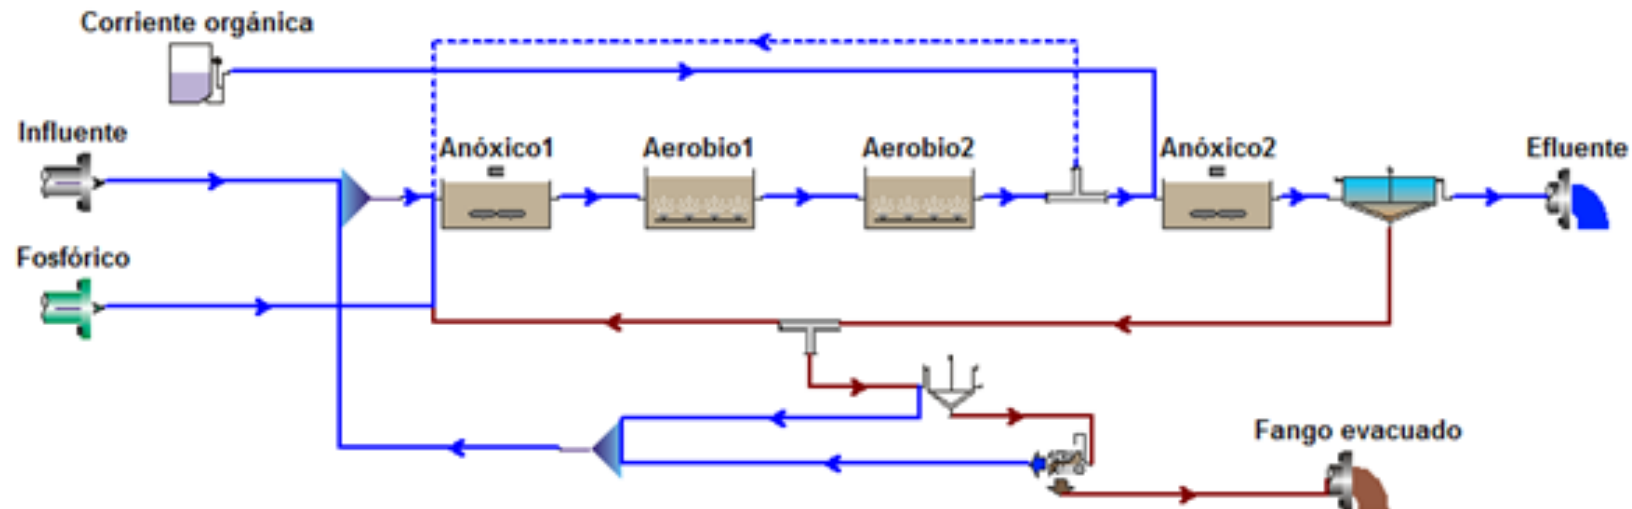

“CFD simulation of activated sludge process”. Oral communication in Congress & Exhibition organized by the IWA and celebrated in Ilmenau (Germany), July 2014.

“Computational simulation of anaerobic digester tank”. Poster in “World Water Congress & Exhibition” organized by the IWA and celebrated in Santiago de Compostela, June 2016.

“New tools for hydrodynamic optimization of WWTP processes”. Iagua magazine, September 2014. (Spanish)

Objetivos:

- *Elaboración del modelo “wide-plant” de la EDAR*
- *Diseño del funcionamiento actual de la EDAR*
- *Cálculo del rendimiento de depuración*
- *Estudio de alternativas de control de proceso*
- *Implementación de mejoras a escala real*

Objetivo:

- Diagnóstico del rendimiento hidrodinámico de reactores biológicos, optimización (reubicación de elementos internos) y modernización (proceso y rediseño).
- DTR para mejorar el comportamiento hidrodinámico (Trazadores fluorescentes).
- CFD para estudiar modificaciones (baffles, agitadores, recirculaciones...).

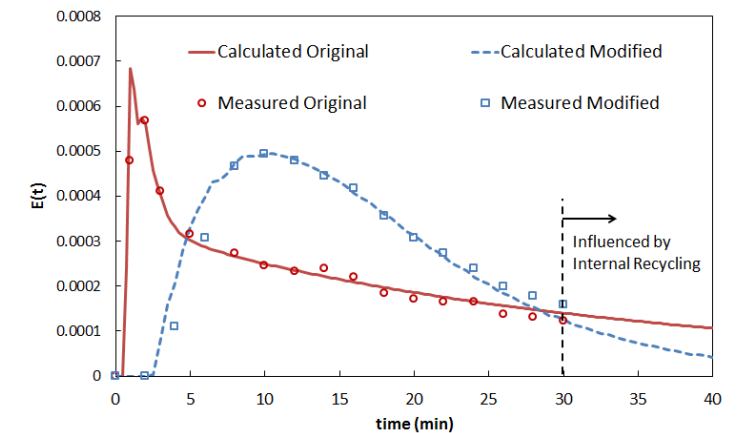

ORIGINAL

MODIFICADA

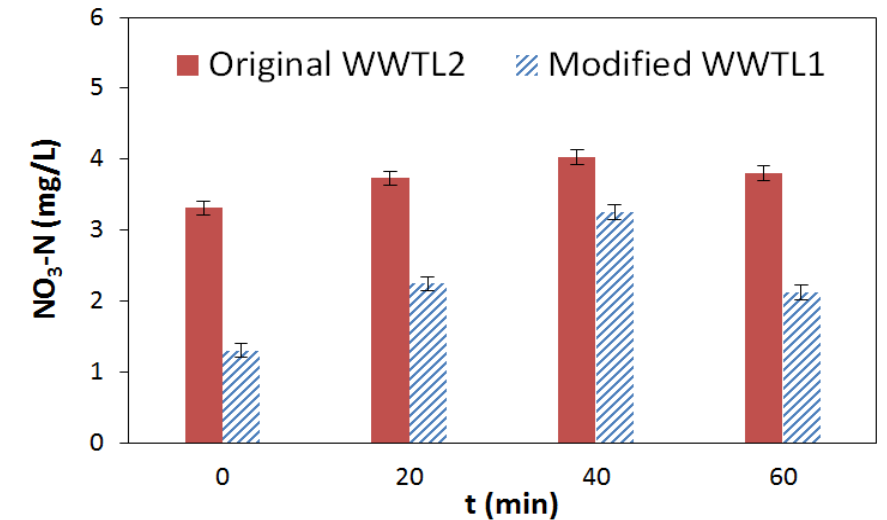

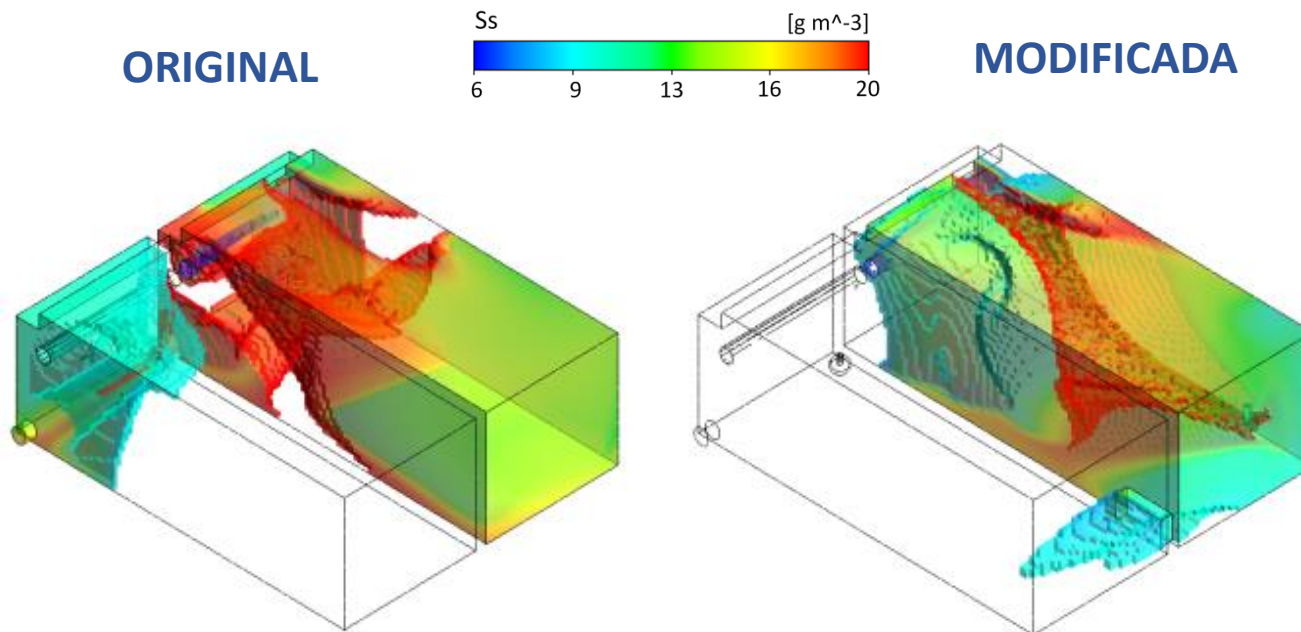

DTR

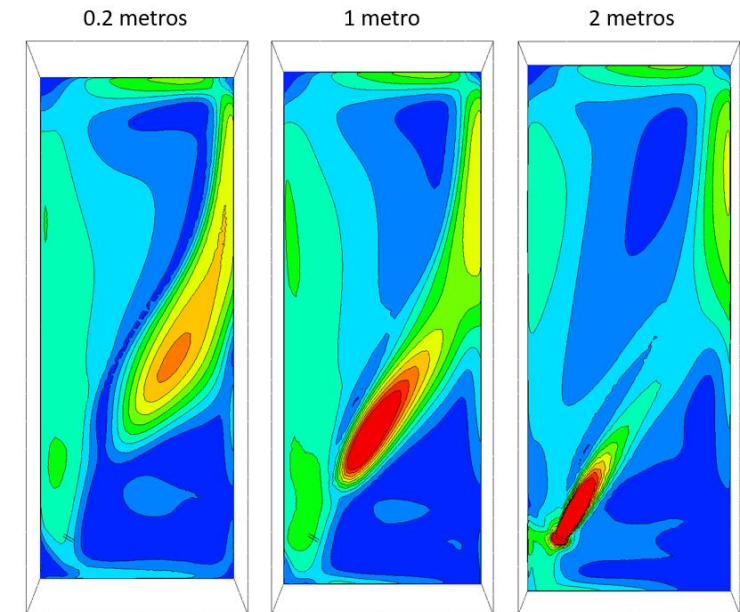

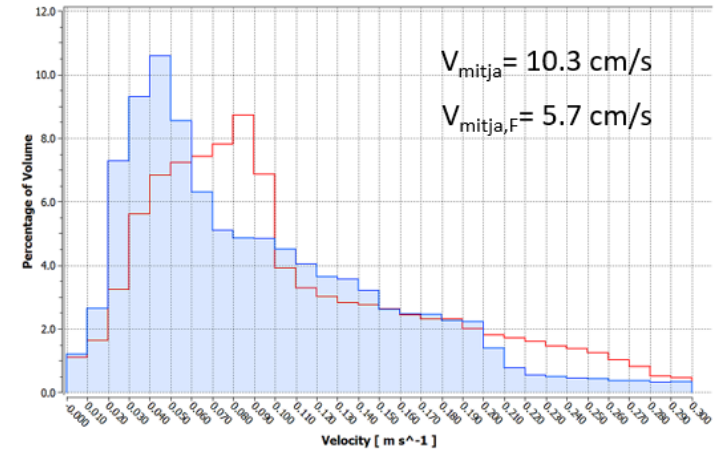

Objetivo:

- Optimización de la eliminación de nutrientes basándose en mejoras hidrodinámicas.
 - Mejorar la eficiencia en el consumo de materia orgánica.
- Implementación de modelos ASM.
- Simulaciones dinámicas del proceso de control completo.

Optimización del mezclado:

Objetivo:

- Evaluar las zonas aerobias y anóxicas en función de los sistemas mecánicos de aireación disponibles.

Hidrodinámica

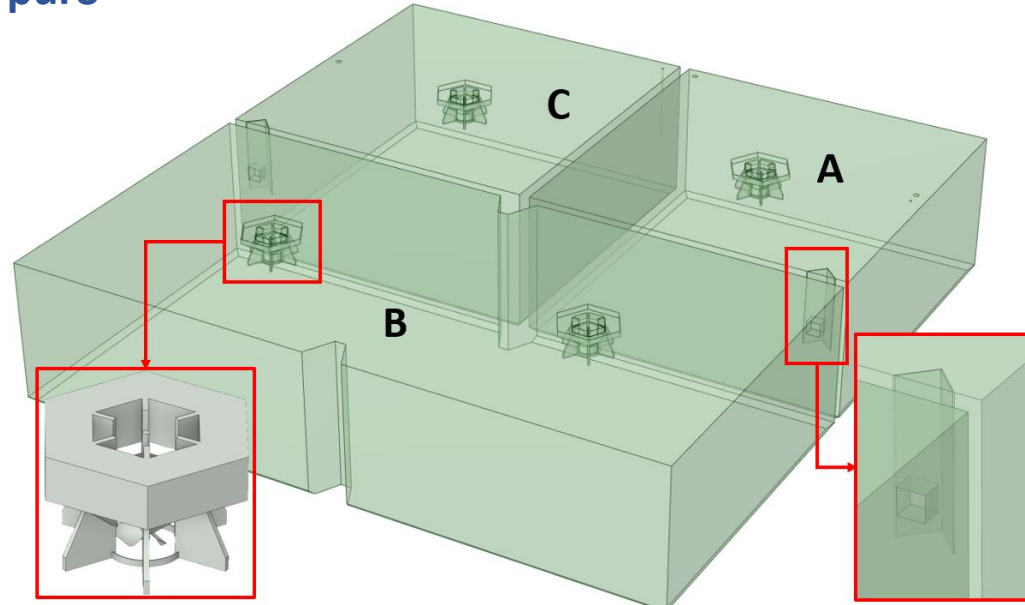

Bioquímica

Objetivo:

- Optimización del reparto de oxígeno puro

Desarenador desengrasador

Separación de grasas

Seguimiento de trayectorias de arenas por tamaños de partícula

Distribución del flujo

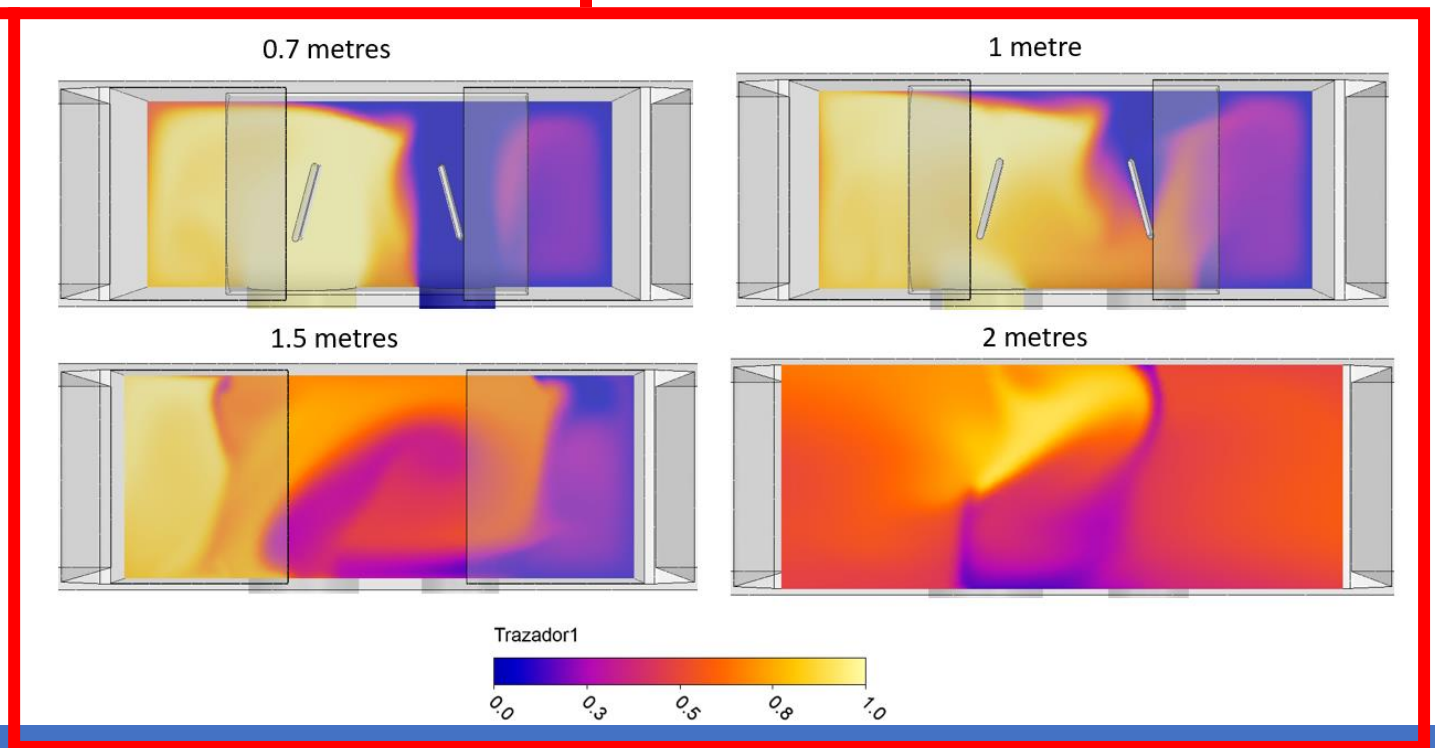

Modelización multifásica con aeración y sólidos

Arquetas y canales de reparto

Objetivo:

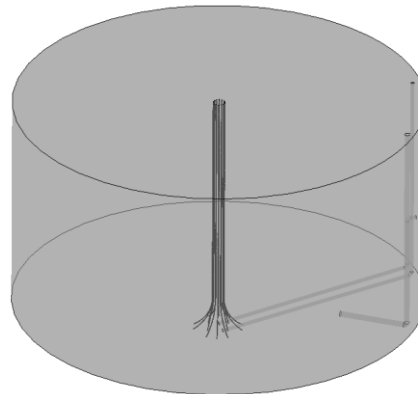

- Trazadores virtuales

Objetivo: Estudio con trazadores inertes en un sistema de agitación mediante lanzas de biogás.

Volumen ocupado por el gas inyectado

Optimización del proceso de digestión anaerobia

Gradiente local de
velocidad

Vel < 0,03 m/s

0,05 m/s < Vel < 0,1 m/s

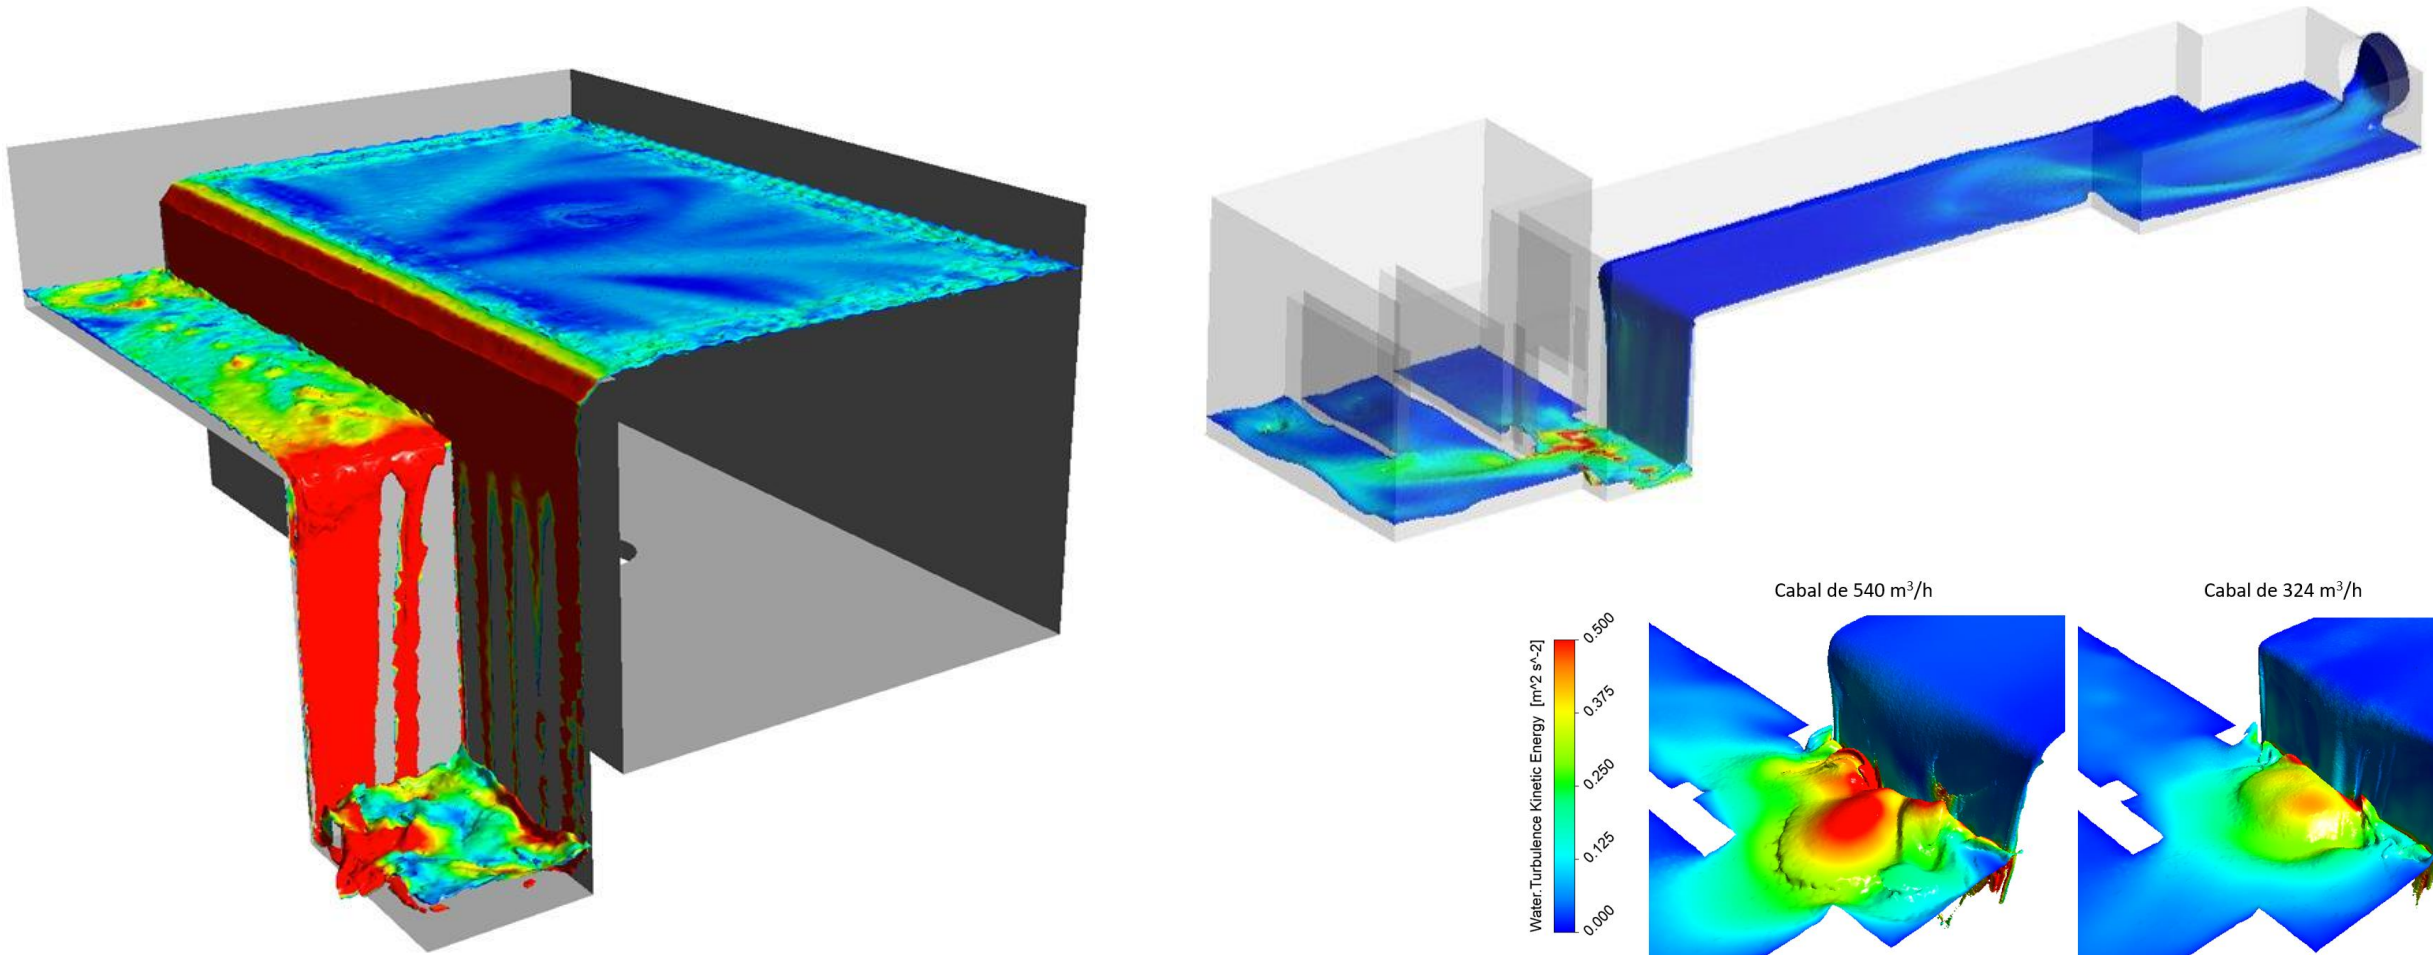

Vel > 0,1 m/s

Aliviaderos en EDAR, EBAR y colectores

Objetivo: Determinar curva de gasto, capacidad máxima hidráulica de tratamiento en EDAR
Mejora en la operación del proceso para minimizar la transferencia de H₂S y mejorar su captación

Objetivo:

- Mejora en el mezclado para asegurar las concentraciones establecidas por consigna en la salida
- Desarrollo CFD de modelos que simulan la hidrodinámica.
- Determinar las localizaciones óptimas de entradas y salidas para maximizar la dilución de nitrato
- Reducir los volúmenes muertos para asegurar una correcta cloración
- Simulaciones en estado transitorio para determinar el tiempo de retención
- Modelización de la generación de Trihalometanos.

Caudal verano

Caudal invierno

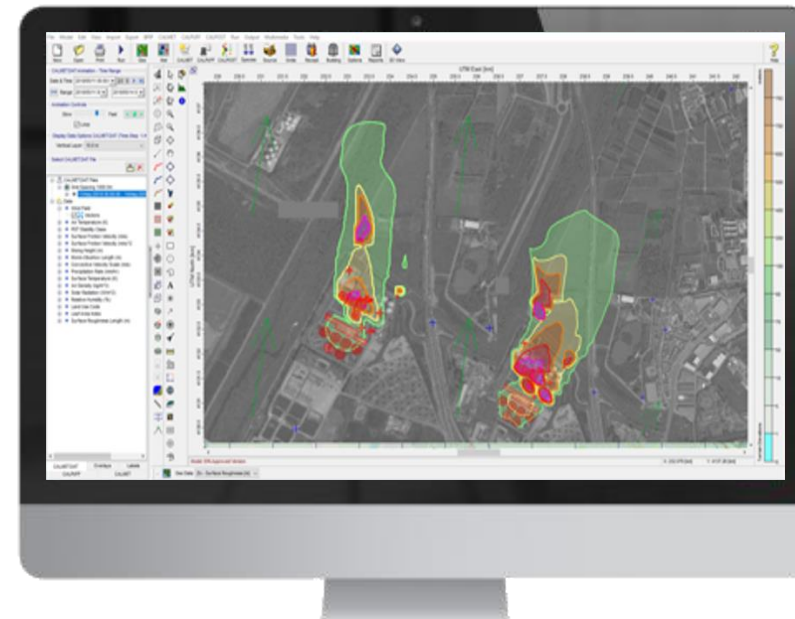

Objetivo:

- Mejorar los sistemas de desodorización de las diferentes zonas “indoor” de la EDAR (edificios de pretratamiento, edificios de deshidratación...).
- Desarrollo de modelos CFD que simulan contaminantes atmosféricos y olores.
- Desarrollo de sensores “low cost” para validar el modelo CFD.
- Propuesta de mejoras y soluciones.

Objetivo:

- Proporcionar una herramienta que permita predecir el impacto del olor producido en la EDAR para mejorar la toma de decisiones y justificar episodios de quejas.
- Cálculo de la distribución del olor mediante el software de dispersión de contaminantes CALPUFF.
- Análisis y estudio de las diferentes variables meteorológicas que afectan a la dispersión de olores.
- Simulación de diferentes escenarios y cuantificación del alcance y la intensidad del olor.

Modelización de vertidos en cauces naturales

Monitorización de vertidos en cauces naturales
